Candlestick pattern analysis pdf

The Japanese candlesticks emerged in the 18th century. The land merchants of the rising sun have strived to predict the future price of rice at that time. In other words, the analysis of the model of the candelabra is the oldest type of technical analysis. Perhaps, candlestick models worked well in the 18th century. However, their use in pure classical form today creates a desire to increase the efficiency of their predictions. In this article: a review of the popular classic models of Japanese candelabras; advantages and disadvantages of using Japanese candelabras; how to increase the efficiency of the lamp model signal, using modern methods and progressive software. Japanese candlesticks could be teddy bears and bullies. Image 1 shows examples of teddy bears and bullies. A combination of one to different candles forms specific models. For a long time the analysis of the model of candelabra was used only in the country of origin — Japan. However, a milestone event occurred in December 1989. At the time, Steve Nison wrote an introductory article about Japanese candlesticks and made the Western world known to them. The article was of such interest that, first, developed in a thesis paper and then in a book. This book by Steve Nison was published in 1991. It is called Japanese Candelstick Charting Techniques and is still a bestseller. Another classic card on the candlestick models is the Encyclopedia of Candelstick Charts. Thewas published in 2008 by thomas bulkowski. in this book thomas developed a ranking of candle models based on historical data testing. thomas calculated the reliability of the models and rated it in percentage terms. in this article, we will hate the terminology and definitions of these 2 great books. authors specify more than 50 subtypes of candles and models of candlesticks. they also share all the models of candelabra in two types: inversion models; models of continuation. We will consider only the most popular ones, which are considered reliable. for our study, we will consider examples in one day and four hours of graphs of future rts indexes (RIH9).3 outside, three days outside – a bully reverse model with 74.% reliability looking for three candles. the first is black at the bottom of a bearish tendency. the second candle is white and closes the body of the first. the third candle is also white and closes higher than the second.3 out, three days off down – it is a model of orsettimana inversion with reliability of 69.% looking for three candles. the first is white at the top of a bullish trend. the second is black and closes the body of the first. the third candle is also black and closes lower than the previous white soldiers.3 – it is a model of bully reverse with reliability of 83.% three high white candles close each other and are closed to the very high. takuri or hammer line – is a bully reverse model64% reliability. Look for a candle with a short body and a much longer shadow lower, more than three times longer than the body, at the bottom of a bearded tendency. Brake belt – is a bully reverse model with 71% reliability. Look for a white candle without a lower shadow with the closure almost on the top at the bottom of a bearded trend. Teddy Bearing Belt – is a teddy reverse model with 68% reliability. Look for a black candle without the upper shadow with the close almost on the bottom at the top of a bullish trend. Engulfing bullish – is a bully reverse model with 62% reliability. Look for a couple of candles. The first is black at the bottom of a bearish tendency. The second candle is long white, which completely closes the body of the first in an ideal model. The images do not show ideal engulfing patterns. Engulfing bearish – is a model of 79% inversion. Once again, look for a couple of candles. The first is white at the top of a bullish trend. The second candle is long black, which closes the body of the first in an ideal model. Last clogged bottom – it is a trending teddy continuation model with the reliability of 66%. Two colored candles during decrease in price. The first is white and the second is black and closes the body of the first, while the shadows can be ignored. Last ingolfing top – is a continuation of a bullish trend with 67% reliability. Two multicolored candles during priceThe first is black and the second is white and closes the body of the first, while the shadows can be ignored. Doji star bearish – is a trend model bullish continuation. Doji are candles, the opening and closing prices of which coincide. There are many subtypes Different Doji: with a long side of two-sided shadows and the body of the candle on either high or low. Doji emergence means uncertainty and absence of the direction of the market price. If Doji emerges after a long white candle and is taller than his body, Bulkowski thinks that the bully tendency with 68% probability continues. It is interesting that this couple is often considered as an inverse model, which is why it is called a bearer star. Doji star bullish – is a model of orsettian trend continuation. As well as in the previous example, if Doji emerges after a long black candle during a bearish trend, according to Bulkowski there is 68% chance of continuation of the price drop. Some sources also consider this model as a reverse. The modern results in the field of technical analysis and computing equipment allow to find confirmation for models of candelabra, that age is calculated in centuries. Increases the efficiency of classic candle models. Download ATAS trial version. Combine Japanese candlestick models with advanced technical analysis and volume tools. Example. Below we see a 5-minute chart of a future RTS index (RIH9) with dynamic levelsand horizontal market profile for the current day. 1 – The maximum level of the volume moves down together with three red candles, closures of which to descend too much. The lower shadow of the third candle gives a signal that some buyers have emerged.2 – The next candle – Doji – informs about a struggle between buyers and sellers. This model could be understood as a trend orseptic continuation, but the subsequent confirmation of the candle is necessary. The next candle is green. It is risky to sell in this situation.3 – Doji emerges again after the green candle at the highest level of volume. In this case, the maximum volume level has become the resistance level. The buyers couldn't push the price up. The next red candle confirms the victory of the sellers. Now, we consider the same situation using clusters. The Bid/Ask Imbalance cluster with 300% overweight and Cluster statistical indicators, Dynamic Levels. We still see candles left from clusters.1 – After the predominance of sellers at 10:25, we can see the drying from sales in low doji at 10:30, while the delta is positive.2 – The predominance of buyers is at the maximum volume level at 10:35 and the delta is positive. But the volume is lower than that was in the previous bars where the sellers were active. It is worth waiting for the next candle to have a clear picture.3 – Dry out of purchases on the doji high at 10:40 immediately after the imbalance buyers warn that they did not push the price upward.4 – Thedominant sellers at 10:45 confirm the growth of the volume. Modern cluster analysis tools help achieve a clear understanding of the market situation and allow you to react quickly. A combination of candelabra models with cluster analysis (such as example) allows you to improve your personal trading strategies. Advantages and disadvantages of Japanese candlestick models. Very simple visual methodConvergence with technical analysis and clusterAvailability of Japanese candelabras in all trading platforms It is necessary to wait for confirmation It is difficult to use them on small times because of algorithmic trading A large number of possible models of candelabra and their combinationsDifferent models of similar models candlestick pattern analysis pdf. candlestick pattern analysis software. candlestick pattern analysis in hindi. candlestick pattern analysis ppt. advanced candlestick pattern analysis. candlestick chart pattern analysis in hindi pdf. candlestick chart pattern analysis in hindi. what is the most bullish candlestick pattern
